

PhaseLine Talent Partners.

Senior commissioning and operations placements for mission-critical builds.

SAMPLE · v1 · 2026-05-27

Invented firm. Anonymized program. No real-client implication.

Capability story

PhaseLine places senior commissioning, integrated-systems, and operations engineers into hyperscale and enterprise data-center programs across the West. The firm runs a deliberate roster, not a database. Every operator on the roster has stood on a critical-facilities floor. Every placement is matched to scope, schedule, and the standards the program actually runs to.

The firm operates from inside the discipline. Recruiters carry commissioning and operations backgrounds. Screening is done by scope · Level 3 through Level 5 functional and integrated testing, energization sequence, hand-off readiness · not by keyword. Programs that hire through PhaseLine get operators who walk on day one, not résumés that need to be re-screened by the engineering manager.

Direct, operator-led intake. Scoped against the program's actual gates. A roster the firm has worked with on programs in the field and continues to track in role. PhaseLine holds a short list, not a long one. It says no when a placement is wrong for the work.

Proof

01

Functional and integrated testing coverage

PhaseLine's roster owns Level 4 functional and Level 5 integrated systems testing on hyperscale builds. Engineers arrive with scripted-test discipline, an operator's reading of what FAT and SAT outputs mean for the program, and the bench credibility to defend a scripted-test result with the owner team in the room. Placements include lead CxA roles, controls-integration leads, and commissioning managers carrying scripted Level 4 and 5 scopes.

02

Schedule and hand-off discipline

PhaseLine matches operators to specific schedule gates · first-energization readiness, integrated systems test, owner hand-off · and selects for the ability to close the gate, not just attend the meeting. The firm builds back from the program's milestone calendar; the operator placed is matched to the gate they have to land.

03

Critical-facilities standards literacy

The roster carries fluency in the standards programs hire against:

- Uptime Tier I through IV classifications and the operator implications of each.
- ASHRAE TC 9.9 thermal classes (A1 through A4) and the cooling design they imply.
- NFPA 70E (electrical safety) and NFPA 72 (fire alarm and signaling), and the commissioning coordination both require.
- IEEE 1584 (arc-flash) and IEEE 3007 (mission-critical power distribution) on the controls and integration side.
- BMS and EPMS integration points and the control-system commissioning that ties them together.

Operators work in the standard, not around it.

Operator credibility

PhaseLine is led by a commissioning operator with eight-plus years on critical-facilities floors before recruiting · hands-on functional and integrated testing, control-system integration, and owner hand-off. Recruiters carry the same background. The roster is real people the firm has worked with on programs in the field, vouched for in writing, and continues to track in role.

IMAGE SLOT · PORTRAIT

Lead operator. Business-formal. Brand-bible neutral background.
With written release.

APPROVED NON-SECURE

WITH RELEASE

The named decision

ROLE	Senior Commissioning Manager
PROGRAM	Hyperscale data-center build, West region (owner anonymized)
SCOPE	• Own the commissioning program from Level 3 method-of-procedure through Level 5 integrated systems test. • Coordinate with the design team, the GC, and the owner's integration team. • Lead the FAT, SAT, and owner hand-off cycle. • Drive the hand-off binder and operations-readiness package.
WHY PHASELINE	The roster is built for this exact scope. The placement is matched against the program's actual gates · first-energization readiness, IST sequence, hand-off · not a generic JD. The operator placed will walk on day one ready to defend a scripted-test result in front of the owner.

Security-safe visual proof

Image set built only from approved, non-secure material per WEDGE_OFFER_SPEC §5. No data-center floor, no cage or rack layouts, no security or access systems, no client logos or named owners, no PII without written consent.

IMAGE SLOT · OPERATOR IN PPE, CONTROLLED SETTING

Training room, mockup, shop, or yard. Non-secure. Operator with release.

APPROVED NON-SECURE

WITH RELEASE

IMAGE SLOT · TOOLS AND PPE, BENCH FRAME

Controlled setting. No identifying equipment, no client-tagged gear.

APPROVED NON-SECURE

Why this is the obvious yes

- Placed against the actual program gates the role has to clear, not a job title.
 - A recruiting team that understands the work, not a database that surfaces résumés.
 - A firm whose roster has stood on the floor before placement.
 - Direct access to the operator behind the firm; no layered gatekeeping.
 - A short list the firm is willing to defend, not a long list shipped to win headcount.
-

NEXT STEP · CANDIDATE

Contact the named recruiter at PhaseLine directly. PhaseLine's own channel, on PhaseLine's intake.

NEXT STEP · OWNER OR GC

Request the scoped roster for the program. PhaseLine's own intake.

Capability profile · one screen

PhaseLine Talent Partners. Senior commissioning and operations placements for mission-critical builds.

DISCIPLINES

Commissioning (Level 3-5)
Integrated systems testing
Critical operations / shift engineering
Controls integration (BMS, EPMS)

STANDARDS LITERACY

Uptime Tier I-IV
ASHRAE TC 9.9 (A1-A4)
NFPA 70E, NFPA 72
IEEE 1584, IEEE 3007

COVERAGE

Hyperscale and enterprise
New-build, retrofit, expansion
West region focus; broader US on scoped programs

ENGAGEMENT MODEL

Scope-matched, schedule-anchored placements
Direct operator-led screening
Confidential program intake
